01 · MOTIVATION

Problem Statement

1

Tradition over data

Crop choices rely on experience, not systematic soil, terrain, or climate evaluation.

2

Static, expert-driven tools

Frameworks like AHP depend on fixed expert weights and don't adapt per field.

3

Coarse resolution

Suitability tools operate at district/block level, missing small and marginal landholders.

4

Low transparency

Existing yield models offer little insight into which factors drive predictions.

5

No integrated system

No accessible tool fuses soil, terrain, and satellite data into one plot-level pipeline.

02 · OVERVIEW

Abstract

A GeoAI-based framework for plot-level land suitability classification and crop yield prediction — piloted on Coimbatore district, Tamil Nadu.

1

Suitability Classifier

Categorizes plots using soil, terrain & environmental data

2

Crop Recommendation

Suggests the most viable crop for a given plot

3

Yield Prediction (LSTM)

Forecasts yield using temporal & spatial patterns

4

SHAP Explainability

Interprets predictions and key driving factors

Combines machine learning with interpretable AI to deliver a scalable, transparent decision-support tool for agricultural planning.

03 · FOUNDATION

Dataset and Tech Stack

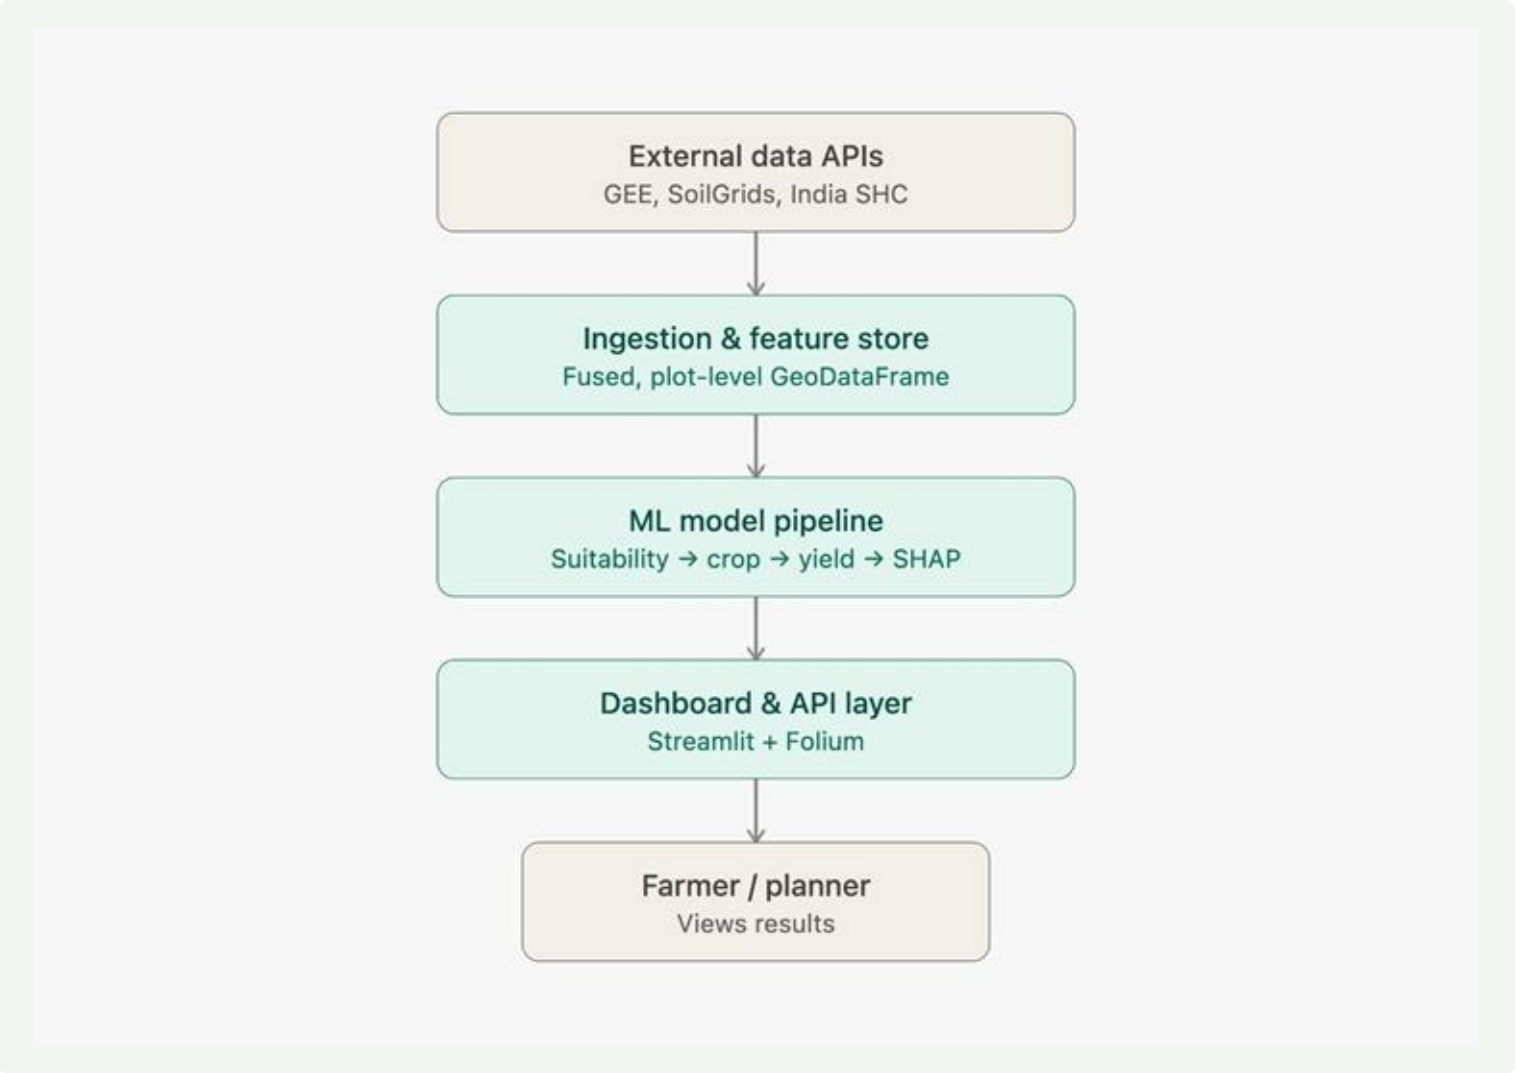

DATASET

- Study area: Coimbatore district, Tamil Nadu
- ~3,725 plots × 10 attributes (1 km grid)
- Terrain — elevation, slope, aspect (SRTM via GEE)
- Vegetation — NDVI (Sentinel-2 via GEE)
- Soil — pH, organic carbon, clay, sand (SoilGrids)
- Boundaries — Tamil Nadu district shapefiles (GitHub)
- Storage — Google Drive (GEE exports)

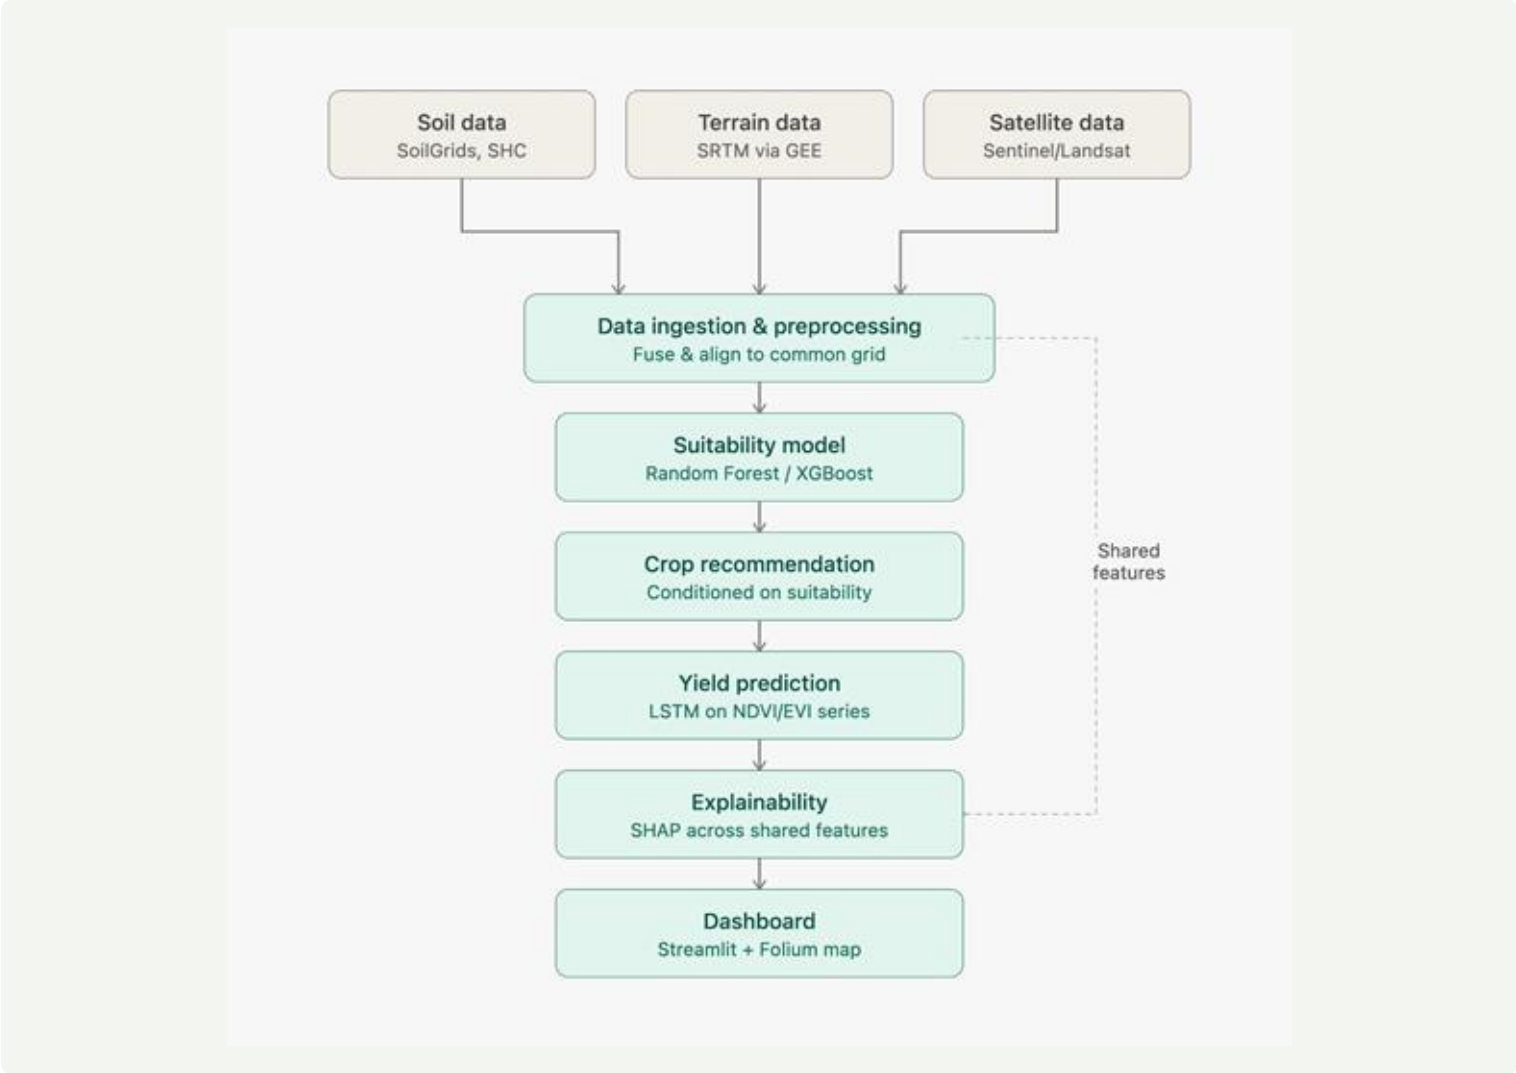

TECH STACK

- Python 3.x · Jupyter / Google Colab
- Rasterio, GeoPandas, Shapely — geospatial processing
- Pandas, NumPy — data handling
- Scikit-learn — suitability & crop recommendation
- TensorFlow / Keras — LSTM yield prediction
- SHAP — model explainability
- Matplotlib, Seaborn — visualization
- Git / GitHub — version control

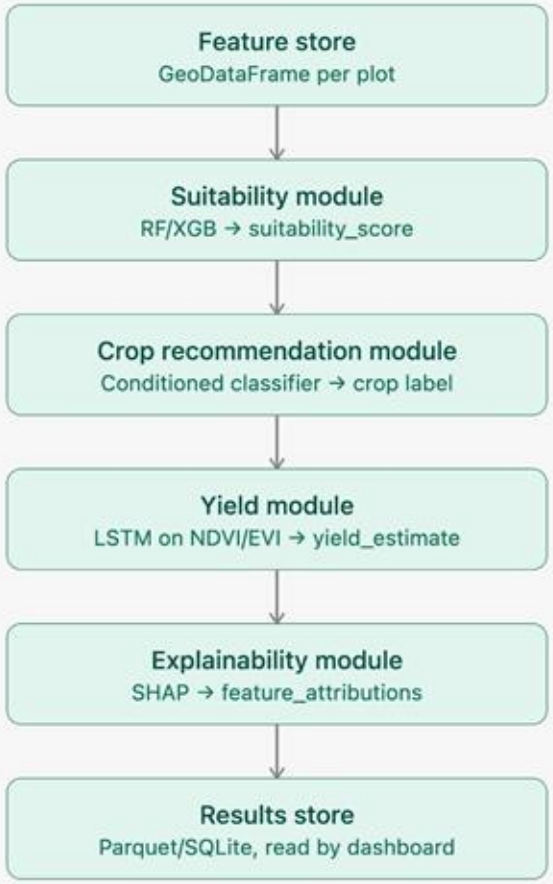

System Architecture

Module / Pipeline Design

Implementation

Step 1.1 — Study Area

```
1
<Axes: >
```

Step 1.2 — Plot Grid

```
print(len(plot_grid))
```

```
3902
```

Implementation

Step 1.3 — Terrain Data

```
Mounted at /content/drive
(3902, 5)
```

	system:index	aspect	elevation	slope	.geo
0	0_0	168.94258	791	23.211750	{"geodesic":false,"type":"Point","coordinates"...
1	1_0	219.54485	842	18.566063	{"geodesic":false,"type":"Point","coordinates"...
2	2_0	111.48539	1153	5.051475	{"geodesic":false,"type":"Point","coordinates"...
3	3_0	106.25545	631	24.827124	{"geodesic":false,"type":"Point","coordinates"...
4	4_0	34.11599	729	6.691145	{"geodesic":false,"type":"Point","coordinates"...

Implementation

Step 1.6 — Soil Data

(3902, 6)

	phh2o	soc	clay	sand	lon	lat
0	53	509	344	376	76.925797	10.24012
1	54	549	335	374	76.915797	10.24012
2	54	406	365	334	76.925797	10.25012
3	53	451	353	381	76.935797	10.24012
4	53	373	349	379	76.945797	10.24012

Implementation

Step 1.7– Final Dataset

	elevation	slope	aspect	NDVI	phh2o	soc	clay	sand	lon	lat
0	791	23.211750	168.942580	0.821879	5.3	509	34.4	37.6	76.925797	10.24012
1	842	18.566063	219.544850	0.791460	5.4	549	33.5	37.4	76.915797	10.24012
